

POSITION VERIFICATION SYSTEM

The Durco plug valves are the most reliable valves whenever a customer requires positive shutoff. This position verification system offers positive reassurance that the valve is fully closed.

- Allows customer to positively verify the valve is in the closed position
- Can be used in standard G4, Marathon or severe service valves
- Available in sizes 1/2" to 4" ASME Class 150 or 300

When valve is in fully closed position, side ports open to allow passage of a monitoring gas through plug waterway to verify the position. In any other plug position, the side ports remain blocked.

Among the applications for this system are the following:

- Gas burner systems
- Toxic media
- Highly corrosive or reactive fluids
- Expansive media (ports permit escape of trapped gases)
- Fluid sampling
